## Localization

Localization: A functor which assigns to each group *G* a unique  $\pi$ -local group  $G_{\pi}$  (where  $\pi$  is a set of primes).

#### Definition

A group G is said to be  $\pi$ -local if the map

 $x \mapsto x^q$ 

is bijective for every prime  $q \notin \pi$ .

A  $\pi$ -localization of any group G is a homomorphism

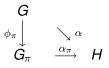

$$\phi_{\pi}: \boldsymbol{G} 
ightarrow \boldsymbol{G}_{\pi}$$

where  $G_{\pi}$  is a  $\pi$ -local group, with the universal property that given any homomorphism  $\alpha : G \to H$ , with H $\pi$ -local, there exists a unique homomorphism  $\alpha_{\pi} : G_{\pi} \to H$  such that  $\alpha_{\pi}\phi_{\pi} = \alpha$ . Localizations of finitely generated soluble groups

Niamh O'Sullivan

## Localization

If  $\alpha : G \rightarrow H$ , where *H* is  $\pi$ -local, then we have the following commutative diagram:

If  $\alpha : G \rightarrow H$ , then we have the following commutative diagram:

 $\begin{array}{cccc} G & \stackrel{\alpha}{\longrightarrow} & H \\ \phi_{\pi} & & & \downarrow \phi_{\pi} \\ G_{\pi} & \stackrel{\alpha_{\pi}}{\longrightarrow} & H_{\pi} \end{array}$ 

If *A* is an abelian normal subgroup of *G*, then the conjugation action of *G* on *A* induces an action of *G* on  $A_{\pi}$ .

Localizations of finitely generated soluble groups

## **Examples**

Let  $\pi$  be a set of primes, we say  $b \in \pi'$  if all the primes divisors of *b* are not in  $\pi$ . We will assume from now on that  $\pi$  is a proper subset of the set of all primes.

If G is a finite group, then

$$G_{\pi}=G/T_{\pi'}$$

where  $T_{\pi'}$  is the subgroup generated by the  $\pi'$ -torsion elements of *G*.

$$\mathbb{Z}_{\pi} = \left\{ \left. rac{a}{b} \right| a, \, b \in \mathbb{Z}, \, b \in \pi' 
ight\}.$$

If  $N \leq Z(G)$ , then  $(G/N)_{\pi} \cong G_{\pi}/N_{\pi}$

## Nilpotent and virtually nilpotent groups

**Theorem** If G is nilpotent of class c, then  $G_{\pi}$  is nilpotent of class  $\leq c$  (Ribenboim 79).

If *G* is nilpotent, then  $\text{Ker}(G \to G_{\pi}) = T_{\pi'}$ .

If *G* is nilpotent and  $x \in G_{\pi}$ , then there exists  $m \in \pi'$  such that  $x^m \in \phi_{\pi}(G)$ .

If *G* is nilpotent and  $N \triangleleft G$ , then  $N_{\pi}$  embeds in  $G_{\pi}$  and it's image is normal. Furthermore  $(G/N)_{\pi} = G_{\pi}/N_{\pi}$ .

#### Theorem

If G is virtually nilpotent, then  $G_{\pi}$  is virtually nilpotent (Casacuberta and Castellet 92).

Localizations of finitely generated soluble groups

## Morphisms

Localizations of finitely generated soluble groups

Niamh O'Sullivan

If  $\alpha : G \to H$  is an epimorphism, then  $\alpha_{\pi} : G_{\pi} \to H_{\pi}$  is also an epimorphism.

However localization does not usually preserve monomorphisms:

If  $\pi = \{3\}$ , then we have the embedding  $i : C_3 \rightarrow S_3$ ,

$$(C_3)_{\pi} = C_3, \ (S_3)_{\pi} = 1.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ のの⊙

So that  $i_{\pi}$  is not a monomorphism.

## Soluble groups

Localizations of finitely generated soluble groups

Niamh O'Sullivan

## What can we say about localization and soluble groups?

B. Neumann (59) constructed a group *G* with unique  $\pi'$ -roots which did not embed in  $G_{\pi}$ .

Baumslag (60) defined a class of groups that could be embedded in a  $\pi$ -local group. Free groups are in this class.

Class  $\mathcal{P}_{\pi}$ 

## Definition

Let  $\pi$  be a set of primes. A group  ${\it G}$  is said to be in the class  ${\cal P}_{\pi}$  if

(i) G has unique  $\pi'$ -roots;

(ii) if  $x \in G$  has no *m*-th root, for some  $m \in \pi'$ , and

$$D_G(x) = \{g \in G \mid C_G(x) \cap C_G(x)^g 
eq 1\},$$

then  $C_G(x)$  is torsion-free,  $D_G(x)$  is a group and one of the following holds:

(a) 
$$D_G(x) = C_G(x) \leq G$$
 so that  $C_G(x)$  is malnormal;  
(b)  $|D_G(x) : C_G(x)| = 2$  and  $C_G(x) \leq \mathbb{Z}_{\pi}$ .

#### Theorem

If  $G \in \mathcal{P}_{\pi}$ , then G embeds in  $G_{\pi}$ . [Baumslag 60, Cassidy 88]

Localizations of finitely generated soluble groups

## Soluble groups

Theorem

Let  $G \in \mathcal{P}_{\pi}$  be a soluble group which is not  $\pi$ -local. Then  $G_{\pi}$  is not soluble.

Take  $x \in G$  that has no *m*-th root, for some  $m \in \pi'$ , attach roots for *x*:

$$K = G *_{D_G(x)} P.$$

Then  $G_{\pi} \cong K_{\pi}$ , *K* embeds in  $G_{\pi}$ . If  $g \in K^{(t)}$ , then there exists  $h \in K$  such that  $[g, g^h] \neq 1$ . *K* is not soluble and so  $G_{\pi}$  is not soluble. Localizations of finitely generated soluble groups

## Free Soluble groups

Theorem

If G is a free soluble group of derived length at least 2, then  $G_{\pi}$  is not soluble.

Let *G* be a free metabelian group and let A = G'. Then  $C_G(x)$  is manormal, for all  $x \notin A$ . Set

$$H = (A_{\pi} \rtimes G)/T$$
 where  $T = \langle (\phi_{\pi}(a), a^{-1}) \mid a \in A \rangle^{Nc/2}$ 

We have the commutative diagram

 $G_{\pi} \cong H_{\pi}, \quad H \in \mathcal{P}_{\pi} \implies G_{\pi}$  is not soluble. As localization preserves epimorphisms,  $G_{\pi}$  is not soluble whenever *G* is a free soluble group of derived length at least 2.

Localizations of finitely generated soluble groups

## Just Non-X groups

#### Localizations of finitely generated soluble groups

Niamh O'Sullivan

### Definition

A group *G* is said to be just-non virtually nilpotent (JNVN) if *G* is not virtually nilpotent but every proper quotient of *G* is virtually nilpotent. [Robinson-Wilson 84, Zhang 91, De Falco 02]

#### Definition

A group *G* is said to be a  $JNVN_{\pi}$  group if *G* has unique  $\pi'$  roots and is not virtually nilpotent but every proper quotient of *G* with unique  $\pi'$  roots is virtually nilpotent.

## Metabelian groups

Theorem

Let G be a finitely generated metabelian  $JNVN_{\pi}$  group with unique  $\pi'$ -roots. Then  $G_{\pi}$  is not soluble.

If *G* is a finitely generated metabelian  $JNVN_{\pi}$  group, then choose *A* maximal subject to being abelian and containing *G*'.

If  $A \leq N \triangleleft G$ , then Z(N) = 1.

So  $C_A(x) = 1$  and  $C_G(x)$  is malnormal, for all  $x \notin A$ .

A is either an elementary abelian *p*-group or is torsion-free.

*p*-case:  $G \in \mathcal{P}_{\pi}$ .

Torsion-free case: Construct *H* as in the free case.

As before  $G_{\pi} \cong H_{\pi}$ ,  $H \in \mathcal{P}_{\pi}$ .

Hence  $G_{\pi}$  is not soluble.

## Metabelian groups

### Corollary

Let G be a finitely generated metabelian group. Then  $G_{\pi}$  is either virtually nilpotent or is not soluble.

Let G be a finitely generated metabelian group, then

either every quotient of *G* with unique  $\pi'$ -roots is virtually nilpotent and hence  $G_{\pi}$  is virtually nilpotent

or *G* has a  $JNVN_{\pi}$  quotient and hence  $G_{\pi}$  is not soluble.

Localizations of finitely generated soluble groups

## Soluble groups

#### Theorem

Let G be a finitely generated soluble group and let  $\pi$  be a set of primes such that  $\pi'$  is not finite. Then either  $G_{\pi}$  is virtually nilpotent or there exists a set of primes  $\tau$  containing  $\pi$  such that  $\tau \setminus \pi$  is a finite set and  $G_{\tau}$  is not soluble.

Let G be a finitely generated soluble group. Then

either *G* is virtually nilpotent and so  $G_{\pi}$  is virtually nilpotent,

or G has a JNVN quotient.

In the second case  $H = G^n$  is a finitely generated metabelian group, for some *n*.

Let  $\tau = \pi \cup \pi(n)$ .

Then  $G_{\tau}$  is either virtually nilpotent and hence  $G_{\pi}$  is virtually nilpotent or  $G_{\tau}$  is not soluble.
