Let *F* be a field and $X = \{x_1, x_2, ...\}$ a countable set of indeterminates. We denote by $F\langle X \rangle$ the free associative algebra freely generated by *X* and we call polynomials its elements.

Definition

Let A be a F-algebra and $f(x_1, \ldots, x_n) \in F(X)$. We say that $f(x_1, \ldots, x_n)$ is a polynomial identity for A if $f(a_1, \ldots, a_n) = 0$ for any $a_1, \ldots, a_n \in A$. In particular, if there exists a non-trivial polynomial identity for A, we say that A is an algebra with polynomial identities or, briefly, Pl-algebra.

We consider T(A), the ideal of all polynomial identities of Aand the space V_n of all multilinear polynomials in nindeterminates. If the characteristic of F is 0, T(A) is generated, as a T-ideal, by the subspaces $V_n \cap T(A)$.

kemark

It is more efficient to study the factor space $V_n(A) = V_n/(V_n \cap T(A))$ in fact, although the intersection $V_n \cap T(A)$ is huge as n goes to infinity, if A is a PI-algebra, $V_n(A)$ grows at most exponentially (see the famous work of Regev [11])

It is well known that the non-isomorphic irreducible representation of the symmetric group of order n are in one-to-one correspondence with the conjugacy classes of S_n and are described in terms of partitions and Young diagrams.

Remark

We recall that a partition λ of the non-negative integer n ($\lambda \vdash n$) is a sequence of integers $\lambda = (\lambda_1, \dots, \lambda_r)$ such that:

 $\lambda_1 \geq \cdots \geq \lambda_r \geq 1$ and $\lambda_1 + \cdots + \lambda_r = n$

Definition

Given a partition $\lambda = (\lambda_1, \dots, \lambda_r)$, we associate to λ the skew table $[\lambda]$ having r rows and the *i*-th row contains λ_i squares. We call $[\lambda]$ the Young diagram of λ .

For instance, the partition (5, 3, 1, 1) is associated to the following Young diagram:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Definition

Let A be a PI-algebra. If there exist PI-algebras A_1, A_2, \ldots, A_r such that $T(A) = T(A_1) \cdots T(A_r)$, we say that A has a factorable T-ideal.

In particular, if $T(A) = T(A_1)T(A_2)$, we have a nice formula for $\chi_n(A)$ due to Berele and Regev:

$$\chi_n(A) = \chi_n(A_1) + \chi_n(A_2) + \chi_{(1)} \widehat{\otimes} \sum_{k=0}^{n-1} \chi_k(A_1) \otimes \chi_{n-1-k}(A_2) +$$

$$-\sum_{k=0}^n \chi_k(A_1) \otimes \chi_{n-k}(A_2)$$

The algebra $UT_2(E)$

We consider the algebra of upper triangular matrices

$$UT_2(E) := \left\{ \left(egin{array}{cc} a & b \\ 0 & c \end{array}
ight) \mid a, b, c \in E
ight\}$$

with entries in the Grassmann algebra E. It is well known that $UT_2(E)$ has a factorable T-ideal and, in particular,

 $T(UT_2(E)) = T(E)T(E).$

There is a strict connection between the multiplicities of cocharacters and those of proper cocharacters:

Theorem (Drensky [5])

Let A be a PI-algebra and $\chi_n(A) = \sum_{\lambda \vdash n} m_\lambda(A)\chi_\lambda$ its n-th cocharacter. Let $\xi_p(A) = \sum_{\nu \vdash p} k_\nu(A)\xi_\nu$ its p-th proper cocharacter, then

$$m_{\lambda}(A) = \sum_{\nu \in S} k_{\nu}(A),$$

where

 $S = \{\nu = (\nu_1, \ldots, \nu_n) \mid \lambda_1 \ge \nu_1 \ge \lambda_2 \ge \nu_2 \ge \cdots \ge \lambda_n \ge \nu_n\}.$

Theorem (see C. [3])

$$\chi_n(UT_2(E)) = \sum m_\lambda \chi_\lambda$$
, where

$$\lambda = (k_1, k_2, 2^m, 1^l) \text{ or } \lambda = (k_1, k_2, 3, 2^m, 1^l).$$

If $\lambda = (k_1, k_2, 2^m, 1^l)$, then

$$\begin{split} m_{\lambda} &= 12(k_1 - k_2 + 1)(l+1) \quad if \ k_1 \geq k_2 \geq 3, \ m \geq 1 \\ m_{\lambda} &= 4(k_1 - k_2 + 1)(2l+1) \quad if \ k_1 \geq k_2 \geq 3, \ m = 0 \\ m_{\lambda} &= 8(k_1 - 2)(l+1) + 4(l+1) \quad if \ k_1 \geq k_2 = 2, \ m \geq 1 \\ m_{\lambda} &= 3(k_1 - 2)(2l+1) + 3l + 2 \quad if \ k_1 \geq k_2 = 2, \ m = 0 \\ m_{\lambda} &= (k_1 - 2)(2l-1) + l + 1 \quad if \ k_1 \geq 2, \ k_2 = 0, \ m = 0, l \geq 1 \\ m_{\lambda} &= 1 \quad if \ \lambda = (1^l) \ or \ \lambda = (k). \end{split}$$

If $\lambda = (k_1, k_2, 2^m, 1^l)$, then $m_{\lambda} = 4(k_1 - k_2 + 1)(l + 1)$ if $k_2 \ge 3, m \ge 1$.
