## Graphs associated to the set of irreducible character degrees

- Prime degree graph, namely $\Delta(\mathrm{G})$, which is an undirected graph whose set of vertices is $\rho(\mathrm{G})$; there is an edge between two different vertices $p$ and $q$ if $p q$ divides some degree in $c d(G)$.

## Graphs associated to the set of irreducible character degrees

- Prime degree graph, namely $\Delta(\mathrm{G})$, which is an undirected graph whose set of vertices is $\rho(\mathrm{G})$; there is an edge between two different vertices $p$ and $q$ if $p q$ divides some degree in $c d(G)$.
- Common divisor degree graph, namely $\Gamma(\mathrm{G})$, which is an undirected graph whose set of vertices is $\operatorname{cd}(\mathrm{G}) \backslash\{1\}$; there is an edge between two different vertices $m$ and $k$ if $\operatorname{gcd}(m, k) \neq 1$.

## Graphs associated to the set of irreducible character degrees

## Character degrees of Frobenius groups

## Character degrees of Frobenius groups

## Theorem

Let G be a solvable group and assume that $\mathrm{G}^{\prime}$ is the unique minimal normal subgroup of G . Then all nonlinear irreducible characters of G have equal degree $f$ and one of the following situations obtains:
(1) G is a p-group, $\mathrm{Z}(\mathrm{G})$ is cyclic and $\frac{\mathrm{G}}{\mathrm{Z}(\mathrm{G})}$ is elementray abelian group of order $\mathrm{f}^{2}$.
(2) G is a Frobenius group with abelian Frobenius complement of order f.

## Character degrees of Frobenius groups

Suppose that $\mathrm{B}(\mathrm{G})$ is 3-regular for a finite group G . Then $\mathrm{B}(\mathrm{G})$ is connected.

## Theorem

Let G be a group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is n -regular for $n \in\{2,3\}$, then $G$ is solvable and $\Delta(G) \simeq K_{n+1} \simeq \Gamma(G)$.

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If at least one of $\Delta(\mathrm{G})$ or $\Gamma(\mathrm{G})$ is not complete, then $\Delta(\mathrm{G})$ is neither 2-regular, nor 3-regular.

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is regular, then it is a complete graph. Furthermore, if $\Gamma(\mathrm{G})$ is not complete, then $\Delta(\mathrm{G})$ is isomorphic with $\mathrm{K}_{\mathrm{n}}$, for $\mathrm{n} \geqslant 5$.

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is regular, then it is a complete graph. Furthermore, if $\Gamma(\mathrm{G})$ is not complete, then $\Delta(\mathrm{G})$ is isomorphic with $\mathrm{K}_{\mathrm{n}}$, for $\mathrm{n} \geqslant 5$.

- $\mathfrak{n}(\mathrm{B}(\mathrm{G}))=1$.

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is regular, then it is a complete graph. Furthermore, if $\Gamma(\mathrm{G})$ is not complete, then $\Delta(\mathrm{G})$ is isomorphic with $\mathrm{K}_{\mathrm{n}}$, for $\mathrm{n} \geqslant 5$.

- $\mathfrak{n}(\mathrm{B}(\mathrm{G}))=1$.
- $\Delta(\mathrm{G})$ is a non-complete regular graph

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is regular, then it is a complete graph. Furthermore, if $\Gamma(\mathrm{G})$ is not complete, then $\Delta(\mathrm{G})$ is isomorphic with $\mathrm{K}_{\mathrm{n}}$, for $\mathrm{n} \geqslant 5$.

- $\mathfrak{n}(\mathrm{B}(\mathrm{G}))=1$.
- $\Delta(\mathrm{G})$ is a non-complete regular graph, $\Rightarrow \mathrm{G} \simeq \prod M_{i}$, where for each $i, M_{i}=P_{i} Q_{i}$ with $P_{i} \in \operatorname{Syl}_{p_{i}}(G)$ is normal nonabelian, and $\mathrm{Q}_{\mathrm{i}} \in \operatorname{Syl}_{\mathrm{q}_{\mathrm{i}}}(\mathrm{G})$ is not normal in G, (D. M. Kasyoki, 2013).

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is regular, then it is a complete graph. Furthermore, if $\Gamma(\mathrm{G})$ is not complete, then $\Delta(\mathrm{G})$ is isomorphic with $\mathrm{K}_{\mathrm{n}}$, for $\mathrm{n} \geqslant 5$.

- $\mathfrak{n}(\mathrm{B}(\mathrm{G}))=1$.
- $\Delta(\mathrm{G})$ is a non-complete regular graph, $\Rightarrow \mathrm{G} \simeq \prod M_{i}$, where for each $i, M_{i}=P_{i} Q_{i}$ with $P_{i} \in \operatorname{Syl}_{p_{i}}(G)$ is normal nonabelian, and $\mathrm{Q}_{\mathrm{i}} \in \operatorname{Syl}_{\mathrm{q}_{\mathrm{i}}}(\mathrm{G})$ is not normal in G, (D. M. Kasyoki, 2013). Contradicts three regularity of $\mathrm{B}(\mathrm{G})$.

## Simultaneous Regularity of $\mathrm{B}(\mathrm{G})$ and $\Delta(\mathrm{G})$

## Corollary

Let G be a solvable group whose $\mathrm{B}(\mathrm{G})$ is a 3-regular graph. If $\Delta(\mathrm{G})$ is regular, then it is a complete graph.
